

Why Legacy ITSM Customers Should Assess Halo

Enterprise-grade ITSM. Lower cost. Less complexity. Faster value.

info@captiv-8.co.uk | www.captiv-8.co.uk

The Executive Question

Are we paying for platform potential, or for measurable service outcomes?

- **Challenge:** your incumbent ITSM platform may be powerful. The issue for many customers is whether the platform has become too expensive, too specialised and too slow to adapt for the outcomes they need.
- **Decision:** assess whether Halo can deliver the required service management outcomes with lower cost, lower friction and faster value.

The Cost and Complexity Problem

The licence cost is visible. The wider platform burden is often harder to see.

Why Halo Is Different

Enterprise-grade service management with a simpler operating and commercial model.

Simple by Design

Clean user experience and logical no-code configuration means less dependence on development skills.

Rapid Value

Pragmatic deployment and rapid iteration; be up and running in weeks, not months.

Power Simplified

Enterprise-grade ITSM and ESM with built-in AI, automation and reporting, delivered without platform bloat.

Customer First

A privately owned British software company that puts customer outcomes before investor pressure.

CIO Lens: Less Platform Burden

No-code configuration changes how the platform is owned and improved in BAU.

From Specialist Platform Dependency

- Specialist administrators
- Developers for many changes
- Customisation to maintain
- Partner dependency
- Slower business response

To Service-Led Configuration

- No-code configuration
- Service-team-led change
- Simpler BAU ownership
- Targeted integration expertise
- Faster iterative improvement

The Cost-Saving Case for Moving from Legacy to Halo

A simpler commercial model: lower TCO, without compromising core ITSM capability

Legacy Cost Model	Halo Cost Model
Multiple subscriptions and product packages	One simpler subscription model
Additional module licensing as usage expands	Access to all core modules at no extra cost
Integration licensing and delivery complexity	No additional Halo licence cost for integrations
Specialist development required	No-code configuration and extension (aimed at business users)
Larger platform team needed to administer and enhance	Smaller BAU support footprint
Cost increases as more business users adopt the platform	No end-user licence costs
Paid access often linked to broader platform usage	Paid licences focused on agents / fulfilment users
Higher cost of change	Lower cost of continuous improvement
Dependency on developers, architects and release governance	Simpler configuration and faster change cycles
Higher total cost of ownership	Lower total cost of ownership
ROI can be diluted by licensing and delivery overhead	Faster route to measurable value

Halo gives customers more usable service management capability with less commercial friction, lower operational overhead and a faster path to ROI.

Enterprise ITSM Without Enterprise Overhead

For ITSM-led customers, Halo can compete where it matters most.

Incident & Major Incident

Request & Catalogue

Configuration & CMDB

Change & Release

Problem & Knowledge

Dashboards & Reporting

Key Question

Does the customer need every legacy ITSM product line, or does it need excellent ITSM at a materially better TCO?

Integration Ready

Hundreds of integration adapters for third-party systems, with no additional Halo licence cost for integrations.

SAF V2: The Differentiator

A stronger service model for CMDB, TOM, governance and automation.

SDM

Defines services, applications, instances, infrastructure, products and relationships.

TOM

Defines who owns, supports, approves, escalates and governs.

Governance

Keeps data trusted through quality, certification and Suspect CI.

AI & Automation

Uses trusted context for routing, approvals, impact and reporting.

Why SAF V2 matters: It gives Halo a unique and practical operating model, not just a configuration approach, connecting trusted data, clear ownership and service-led automation into one framework.

Migration Without the Headache

A structured transition reduces delivery risk and avoids a lift-and-shift of old complexity.

The goal is not to lift and shift legacy complexity; it is to move to a simpler, cleaner and more valuable operating model in Halo.

Where Halo Is the Right Fit

One platform, multiple adoption patterns: from rapid to intelligent automation at scale.

1

Small / Growing Teams

Fast, Simple, Ready to Go!

Rapid ITSM, minimal configuration,
affordable adoption.

2

Mid-Market Companies

Configured for Clarity

CMDB, workflows, approvals,
integrations, dashboards.

3

Large Enterprises

Intelligent automation at scale

SAF V2, service modelling, TOM,
governance and AI support.

Fit Assessment: Halo is most compelling where the organisation wants enterprise-grade service management outcomes without the same level of platform cost, complexity and specialist resource dependency.

Recognised by Gartner

Halo has been recognised as a Challenger in the 2026 Gartner® Magic Quadrant™ for IT Service Management Platforms.

- Gartner recognising Halo as a Challenger in 2026 isn't just a badge, it validates exactly what we've been telling the market. The days of needing a massive, overly complex legacy platform just to run standard IT operations are over.
- For organisations like yours, this means you get a platform that executes on advanced use cases like enterprise service management and AI automation without the exorbitant licensing costs, heavy maintenance overhead, or multi-year implementation cycles.

Figure 1: Magic Quadrant for IT Service Management Platforms

Migration Feasibility and Value Assessment

A low-risk way to test whether Halo is commercially and operationally compelling.

Why Captiv-8 Is Credible

We know the legacy ITSM market because we have delivered, extended and optimised it at scale. Halo is where we now see the strongest opportunity for customer value.

Enterprise ITSM experience

We have worked across ServiceNow, BMC and other legacy ITSM platforms, giving us a clear view of what good service management looks like at scale.

Automation expertise

We provide a structured model for service data, ownership, CMDB, TOM, governance and automation in Halo, giving customers the foundations required for trusted, service-led automation.

Migration judgement

We assess whether a move to Halo is viable, valuable and low risk, then reduce the migration headache by shaping the scope, design, data, processes, integrations and adoption plan.

Platform judgement

We understand both the value and the limitations of legacy ITSM platforms and have pivoted towards Halo because it offers a stronger balance of capability, simplicity, cost control and customer-first service management.

Captiv-8

Final Thoughts

If your organisation is reviewing the cost, complexity or long-term value of your legacy ITSM platform, **Captiv-8** can help you determine whether Halo is a credible and commercially compelling alternative.

Assessment Area	What We Help You Understand
Commercial viability	Potential licence, delivery, BAU and total cost savings.
Platform fit	Whether Halo can meet your ITSM, CMDB, catalogue, reporting and automation needs.
Migration complexity	What data, processes, integrations and users would need to move.
Delivery approach	How the migration could be phased to reduce risk and disruption.
Business case	Whether the move delivers enough financial, operational and strategic value.

Call to Action: Contact Captiv-8 to arrange a legacy ITSM to Halo feasibility review.
